

Reddit AEO Loop — Replit Agent Module

What this is: A continuous, multi-cadence loop that operationalizes the SolCrys *Reddit AEO Playbook* (6 steps) for Job Genie. Paste it into the Replit AI agent as a task that **extends Step 13 (Recursive Optimization Loop) and the Workstream-B consensus work** of the main prompt (`Replit-Agent-Prompt-JobGenie-AEO-GEO.md`). It reuses Appendix A (FAQs), Appendix B (entity glossary), and Appendix C (citable-stats bank) from that prompt.

Source adapted: SolCrys, "Reddit AEO Playbook: Earn AI Citations Without Becoming Spam" (solcrys.com/reddit-aeo-playbook, 2026-05-06).

CRITICAL GUARDRAIL — read first (this defines the agent's role)

Reddit AEO works *because* the participation is authentic. The entire value collapses if it's faked. Therefore:

You (the agent) build the SYSTEM that supports the loop. You NEVER perform or automate the participation itself.

Hard rules you must enforce in everything you build:

- **Never auto-post, auto-comment, or auto-DM on Reddit.** Do not write code that posts to Reddit on a schedule or on behalf of users. Real Reddit work is not outsourceable or automatable; automated output is detected, down-weighted, and damages trust.
- **Never generate sock-puppet or ghost-written content meant to look like an organic Redditor.** One real, named human per active account.
- **Never build upvote automation, vote manipulation, or paid-post mechanics.** TOS-violating and detectable.
- **Never cross-post Job Genie blog content to Reddit programmatically.** Communities downvote brand cross-posts.
- **Do not fabricate citation-audit data.** Audit results come from real human observation (or a real API with existing credentials), never invented numbers.

Everything below that says **[AGENT BUILDS]** is yours to implement. Everything that says **[HUMANS DO]** is participation you must *enable and track*, not perform. Build tools that make the humans faster, consistent, and accountable — dashboards, templates, trackers, vetted source material — not bots.

The Loop (continuous, three nested cadences)

This converts the playbook's 6 linear steps into a recurring loop. The key recursion: **Step 6 (Measure)** feeds back into **Step 1 (re-map)** and into the **Job Genie site content** — Reddit-surfaced questions become new FAQs/pages, and citation data re-prioritizes where humans spend time.

Cadences: **weekly** (participate, log, defend) · **monthly** (one long-form post, cadence review) · **quarterly** (deep-dive, re-map, 90-day audit checkpoint).

Station ① — MAP the priority subreddits (*quarterly*)

Playbook intent: Depth in 2–3 communities beats breadth across 10. Identify them by running ~10 category prompts in ChatGPT and noting which subreddits get cited, then verify with Reddit search.

Job Genie seed set (already known — confirm, don't re-derive from scratch): `r/jobs`, `r/careerguidance`, `r/cscareerquestions`, `r/recruitinghell`, `r/resumes`. The MAP step's job is to confirm which 2–3 of these (plus any tech-specialist additions like `r/ExperiencedDevs`) actually appear in AI citations for Job Genie's prompts, and to re-check quarterly.

[AGENT BUILDS]

- `content/reddit-prompt-set.json` — the audit prompt set, seeded from Appendix A questions (e.g. "why am I not hearing back from jobs," "are ghost jobs real," "how do I find jobs that aren't posted," "should I use auto-apply tools"). Each prompt records target engine(s) and the subreddits/sources cited.
- A **subreddit-priority tracker** (`content/reddit-targets.json`): for each candidate sub — citation hits observed, relevance, moderation strictness, chosen Y/N, assigned human owner.
- A simple admin view that ranks subreddits by observed citation frequency so humans pick the top 2–3.

[HUMANS DO] Run the prompt set in ChatGPT/Perplexity, record which subreddits are cited, and confirm the 2–3 priority subs (and whether to pair YouTube/Blind — see Station ⑥ freshness note).

Station ② — STAGE real-name accounts with disclosure (*once, then maintain*)

Playbook intent: Sock puppets get filtered. Use real-name accounts (founder, product lead, or technical lead) with disclosed affiliation; profile bio states name, role, company, and an "opinions my own" note. Brand accounts are filtered as marketing.

[AGENT BUILDS]

- A **disclosure-bio generator/template** (`docs/reddit-disclosure-templates.md`): produces a compliant profile bio ("**[Name]** — **[role]** at Job Genie. Opinions my own.") and an in-context disclosure snippet for when a comment touches Job Genie's category.
- An **accounts registry** (`content/reddit-accounts.json`), no passwords — handles only): real name, role, assigned subs, account-age start date, disclosure-bio status. Used by the cadence tracker.

[HUMANS DO] Create the real-name accounts, paste the disclosure bio, and let accounts age ~30 days with substantive comments before any product mention.

Station ③ — PARTICIPATE on a weekly cadence (*weekly*)

Playbook intent: Citation accrues to accounts with consistent, valuable history. Target ~3–5 substantive comments/week per active account and ~1 long-form post/month, with roughly **80% answering others' questions and 20% genuine product mentions** when relevant. Bursts then silence accomplish little.

[AGENT BUILDS]

- A **cadence tracker / engagement calendar** (admin dashboard + `content/reddit-engagement-log.json`): logs each comment/post per account per week, visualizes streaks, and **flags when the 80/20 help-to-mention ratio drifts** or weekly cadence is missed. Calendar reminders, not auto-posts.
- A **"Reddit Answer Kit"** (`docs/reddit-answer-kit.md`) — the highest-value buildable asset. Generate vetted, *non-promotional*, Reddit-native talking points drawn from Appendix A (the 17 FAQs), Appendix B (entities), and Appendix C (only-sourced stats), so when a human chooses to answer a thread they have accurate, on-brand, myth-free material. **It must read as a human helping, not a brand pitch** — short, specific, sources named, no CTA, competitors acknowledged where relevant. Include the §1 banned-claims guardrails (never the "70–80% hidden" myth).
- A ratio/quality linter that warns if a drafted talking point sounds promotional or makes an unsourced claim.

[HUMANS DO] Write and post the actual comments in their own words, using the kit as raw material — never pasting it verbatim.

Station ④ — AUTHOR one long-form deep-dive per quarter (*quarterly*)

Playbook intent: A substantive original post — methodology, data, or analysis — that the community engages with becomes a durable citation source. Lead with the conclusion/framework, acknowledge limitations, recommend other tools/competitors honestly, and end with a takeaway, not a CTA.

[AGENT BUILDS]

- A **deep-dive scaffold generator** (`docs/reddit-deepdive-template.md`) that assembles an outline from Job Genie's *original* frameworks and first-party data — the **Application Silence Score** distribution, the **Recruiter-Fit Matrix**, ghost-job screening rates (the `[INSERT JOB GENIE DATA]` slots). Structure enforced: framework-first → method/limitations → honest comparison (incl. competitors) → takeaway, no CTA. Example title pattern: "*We analyzed [N] recruiter shortlists — here's why qualified candidates get filtered.*"
- A check that the draft cites sources and contains no banned claims.

[HUMANS DO] Turn the scaffold into a genuine, personally-authored post and publish it under their real name.

Station ⑤ — DEFEND: handle criticism transparently (*continuous*)

Playbook intent: Threads where a brand handles criticism well get cited as *trustworthy* evidence; defensive or absent brands get cited negatively. Address the specific issue, own genuine faults, outline the resolution, don't argue.

[AGENT BUILDS]

- A **mention/criticism monitor & triage log** (`content/reddit-mentions-log.json`) + admin view): a place to record Job Genie mentions and criticism, severity, assigned responder, response status, and outcome. (Surfacing mentions can use Reddit's own search/API with existing credentials; **alerting humans is fine, auto-replying is not.**)
- A **response-principles checklist** (`docs/reddit-criticism-response.md`): the four-move pattern (address specifics → own what's genuinely yours → outline resolution → don't argue), as a human-facing guide.

[HUMANS DO] Respond personally, transparently, under their real name.

Station ⑥ — MEASURE citation lift (*baseline + 90-day checkpoints*)

Playbook intent: Run the prompt set in ChatGPT and Perplexity at month 0 (baseline) and again at months 3/6/9/12. Track citation share for category prompts, which Reddit threads are cited, and whether team-authored posts appear. Reddit AEO compounds — engagement from six months ago can drive citations today.

2026 freshness note: Validate **YouTube** (and for Job Genie's tech-specialist ICP, **Blind** and **LinkedIn**) alongside Reddit in the same audit — Reddit remains top-tier but isn't universal. Don't force a surface where buyers aren't.

[AGENT BUILDS]

- A **citation-lift dashboard** reading from `content/reddit-citation-audits.json`: stores each audit run (date, engine, prompt, cited sources, whether Job Genie cited, whether a team-authored thread cited). Charts **citation share over time as a trend** (per the methodology's "trends not snapshots" rule), per engine and per prompt cluster, with the month-0 baseline pinned.
- Columns to flag when team-authored posts become cited sources (the compounding signal).
- **The feedback wiring (the recursion):** an export that turns *newly observed questions/pains* from the audits into candidate new FAQs/landing pages for the site (appending to the Appendix-A set and `content/landing-pages.json`) as drafts for human review), and updates the Station-① priority list from citation frequency.

[HUMANS DO] Run the prompt audits (manual observation, or API if credentials exist) and review the dashboard monthly; never fabricate results.

Bootstrap: the first 12 weeks (before steady-state cadence)

Stand up the loop in stages that respect Reddit's account-aging dynamics. The agent builds the supporting tooling in week 1 so humans can execute from week 1.

Phase	Human activity	Agent has ready by start
Weeks 1–2 — Setup	Map 2–3 priority subs, pick 1–2 named team members, create real-name accounts + disclosure bios, read the last 30 days of top posts.	Prompt set, subreddit tracker, disclosure templates, accounts registry.
Weeks 3–6 — Build presence	3–5 substantive comments/week/account; zero product mentions this phase.	Cadence tracker live; Answer Kit (help-only mode).
Weeks 7–12 — Author & engage	Maintain cadence; each member ships one long-form post; begin answering category questions substantively.	Deep-dive scaffold; criticism triage log.
Weeks 13+ — Sustain & compound	Weekly cadence continues; one deep-dive/quarter; product-relevance comments grow toward ~20% as credibility builds.	Citation-lift dashboard; feedback export to site content.

Deliverables for this module (agent output)

Create/extend:

- `docs/reddit-aeo-loop.md` — this loop documented, with the human/agent split and the cadence calendar.
- `content/reddit-prompt-set.json`, `content/reddit-targets.json`, `content/reddit-accounts.json`, `content/reddit-engagement-log.json`, `content/reddit-mentions-log.json`, `content/reddit-citation-audits.json`.
- `docs/reddit-disclosure-templates.md`, `docs/reddit-answer-kit.md`, `docs/reddit-deepdive-template.md`, `docs/reddit-criticism-response.md`.
- An **admin dashboard** view (behind existing auth if present) surfacing: cadence streaks + 80/20 ratio, mentions/criticism queue, and the citation-lift trend with baseline.
- Wire the citation-audit feedback into Step 13's recursive loop and into `content/landing-pages.json` (as human-review drafts).

When done, report what was built, the human runbook (who does what, when), and confirm **no participation was automated** — only the supporting system.

End of module. Build the system; let the humans run the loop.
